FARM WAGE RATES UP FROM LAST YEAR, EMPLOYMENT DOWN

Wage rates for hired farm workers averaged 59 cents per hour about the first of October, 2 cents higher than a year earlier, the Bureau of Agricultural Economics reported today. There were about a million fewer persons working on farms during the week of September 17-23, than a year ago. Numbers of family and hired workers decreased at about the same rate. These decreases were largely owing to reduced labor requirements for harvesting the small cotton crop. Changes in timing of some crop operations, and in weather, were also factors.

The index of farm wage rates was 427 percent of its 1910-14 base about October 1, compared to 414 percent a year earlier. All types of wage rates were slightly higher than a year ago. Increases amounted to \$3.00 for monthly rates, 10 to 20 cents for daily rates, and 2 cents for hourly rates. Increases were slightly larger than the national average in the Middle Atlantic, North Central and Mountain Regions, while in the West South Central Region there was little change from last year.

The average of all wage rates increased seasonally from July 1 to October 1. Consequently, there was practically no change in the seasonally adjusted index of farm wage rates during the past quarter. Individual types of wage rates generally showed the usual movements. Hourly rates with house moved upward owing to the increase in number of workers employed at this rate in the high wage areas. On the other hand, hourly rates without board or room dropped because of the usual increase in the number employed in the South at this time of year.

For the country as a whole, hourly wage rates without board or room averaged 66 cents per hour. Hourly rates were highest in North Dakota and Montana where delayed harvest operations led to unusually heavy demand for labor and in Washington and Oregon, the States in which wage rates are usually highest. The average in these 4 States was \$1.00 per hour for workers paid hourly rates. The lowest hourly rates were in the South where hired farm workers were paid from 40 cents per hour in South Carolina to 43 and 44 cents per hour in Mississippi and Alabama. Hourly rates were also less than 50 cents in Georgia, Tennessee, Arkansas, and Louisiana.

The number of persons at work on farms during the week of September 17-23 continued the recent downward trend. In all regions there were fewer persons employed on farms, with the largest decreases occurring in the South

Central and Pacific States. For family workers the largest decreases were in the South. Decreases in numbers of hired workers were largest in the East North Central, South Central and Pacific Regions. The reduction in number of farm workers in the South was largely due to a much smaller cotton crop which has reduced the need for cotton pickers and also to rainy weather in parts of Texas. In the Pacific Region, the number of hired farm workers was less, partly because of timing in crop operations. Grape harvest reached a peak somewhat earlier than usual while harvest of cotton, tomatoes for canning, beans and rice was starting later than a year ago.

The number of persons employed on farms in late September was 14 percent larger than a month earlier, about the usual increase. In the Middle Atlantic and North Central Regions, there were fewer persons employed on farms, also the usual movement. There were larger increases in number of farm workers in the South Central Region, where cotton picking was reaching its peak, than in any others. The increases were about the same as the average for recent years, 52 percent in the East South Central and 36 percent in the West South Central Region.

More farm operators and unpaid members of their families (family workers) were doing farm work during the week of September 17-23 than a month earlier in all parts of the country except the New England, Middle Atlantic and East North Central States. The largest increases were in the East and West South Central States, although they were a little less than usual. However, increases in the numbers of hired workers were larger than usual in these States. There were 73 percent more hired farm workers in the East South Central and 34 percent more in the West South Central States than a month earlier. Increases in the number of hired farm workers ranged from 13 percent to 20 percent in the New England, East North Central and Mountain States. In the Middle Atlantic, West North Central, South Atlantic and Pacific States, there were fewer hired farm workers than in late August.

The New England States had good harvest weather in late September, except for too frequent showers in Vermont. During the week of September 17-23 potato digging was in full swing, with harvest of the crop in heavy-producing Aroostook County nearing the halfway mark. Other farm activities during the week included cranberry and apple harvest, fall plowing, and silo filling.

In the Middle Atlantic States, farm work progressed fairly satisfactorily during the survey week. However, below normal temperatures and wet weather delayed or interrupted some farm operations, particularly in Pennsylvania and New Jersey. Farmers in all States were busy digging potatoes, filling silos, preparing land, and seeding small grains and other fall crops. The peach and pear harvests were ending but apple harvest was a major activity on fruit farms.

Weather was generally favorable for farm work in the East North Central States during the week, except that moisture was a little excessive for some jobs in southern areas of the region. Operations common to many farmers were harvesting corn for silage, fall plowing, and seeding winter grains. Much fruit was still being picked, particularly in Michigan. Potato harvest was under way in all States and sugar beet harvest was starting in most. Vegetables were still being harvested for processing but this activity was expected to end soon. Many farmers were preparing for the corn harvest.

Crops are late in the West North Central States but much progress was made during the survey week. Small grain harvest continued actively in North Dakota and in northern Minnesota and was being completed in South Dakota. Much plowing and seeding was accomplished in all States. Combining of soybeans started in Kansas, Missouri and as far north as southern Minnesota. Potato harvest was active in southern and central States of the Region and beginning in the Red River Valley of Minnesota and North Dakota. Sugar beet harvest was also starting. Much corn and sorghum silage was put up and some corn was being picked in Kansas and Missouri.

Cotton picking progressed rapidly in the South Atlantic States and tobacco harvest was nearing completion. Weather was favorable in the region, except for somewhat excessive rain in some sections of Virginia and West Virginia. Apple harvesting was active in these two States. Other crops being harvested in Virginia included tobacco, cotton, peanuts, potatoes, sweet potatoes, and fall vegetables. Cotton picking was the major activity in the Carolinas and Georgia. Peanut and corn harvest, land preparation and seeding, tobacco drying, and apple picking were additional important activities in these States. In Florida, farm work centered around preparing land for and planting fall truck crops. The cotton harvest was being completed and the citrus harvest starting.

In the East South Central States, cotton picking was active. Progress ranged from near-completion in southern Alabama to just-beginning in Kentucky. It was especially active in Mississippi, where cotton opened rapidly after delay caused by unfavorable weather. Peanut harvest was in full swing in Alabama. Rain hindered plowing and seeding operations in some areas of Kentucky and Tennessee, but in other areas and in Alabama and Mississippi these operations were progressing rapidly. Corn and soybean harvest was well under way in Mississippi and Alabama and corn cutting started in Tennessee and Kentucky.

Harvest conditions in the West South Central States ranged from near ideal to poor during the survey week. Louisiana and some sections of Texas had little rain and cotton picking made rapid progress. However, in Oklahoma and Arkansas cotton bolls were opening slowly and cotton picking was light. Rice harvest was active in Louisiana and Texas and just starting in Arkansas. Many Louisiana and Texas farmers were digging sweet potatoes. In Texas and Oklahoma much wheat was being seeded. Other important activities under way in the region were harvesting of corn, sorghum and peanuts, and seeding of cover crops and pasture grasses.

The small grain harvest season was late in many of the Mountain States and threshing and combining continued to be a major activity in Montana and in the higher areas of Wyoming and Idaho. The potato and sugar beet harvests were getting well under way in Colorado, and were starting in Wyoming, Idaho and Montana. Winter wheat seeding was about complete in New Mexico and was active in the other winter wheat States. Dry bean harvest and threshing was widespread. In Arizona and New Mexico cotton picking was in full swing. Arizona truck crop farmers were busy preparing land, planting, and cultivating fall vegetables.

Harvest work continued active in the Pacific States. Much fruit was still being picked, especially apples in Washington. Fall plowing and seeding was extremely active in Washington and Oregon. Some wheat was still being harvested in Washington. The sugar beet harvest had started and potato digging was well advanced in both Oregon and Washington. Truck crop activity was high in California, including the planting and cultivating of fall crops and harvesting of carrots, lettuce, tomatoes, and other crops. Cotton picking was starting slowly and the rice harvest was also starting. Some citrus was also being picked in California.

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

DEFINITIONS AND EXPLANATIONS

Employment

Farm employment estimates of the Bureau of Agricultural Economics cover persons doing farm work on all farms. Mailed questionnaires are received every month from 15,000 to 20,000 farmers who report the number of persons working on their farms. Interview surveys of farmers are used less frequently to provide bench mark data on employment. The survey week for the mailed questionnaire each month is the last complete calendar week in the month except when that week includes the last day of the month; in that case the survey week is the next to the last full calendar week.

Employment concepts

All farm operators are counted as employed if they spend one hour or more during the survey week at farm work, chores, or in the transaction of farm business. Members of the operator's family or household doing unpaid farm work, or chores, are counted if they put in 15 hours or more during the survey week. Operators plus unpaid members of their families or households who meet these criteria of employment are called family workers. All persons doing one or more hours of farm work or chores for pay during the survey week are counted as hired workers. Members of the operator's family doing farm work for cash wages are counted as hired workers. Croppers are considered family workers when working on their own crops, but hired workers when doing farm work for pay off their own tracts. If a person is employed both as a family worker and a hired worker during the week on the same farm he is counted as a hired worker.

Comparability with other data

The data on farm employment published by the Bureau of Agricultural Economics differ from those on agricultural employment published by the Bureau of the Census in the Monthly Report On The Labor Force. The Bureau of Agricultural Economics collects information from the employer (the farmer) who reports the number of persons working on his farm during the week, regardless of the other jobs held by those workers. The Census data, on the other hand, are obtained through interviews with approximately 25,000 farm and nonfarm households with the housewife or some other member of the household reporting on the labor force status of the household members. They relate only to persons 14 years of age and over, who are in the civilian population and not in institutions.

The difference between the BAE and the Census data is attributable mainly to the different treatment of three groups of workers. Children under 14 years of age who meet the criteria of employment are included in the BAE estimates, but not in the Census Bureau's. It is estimated that this number may reach a summer peak as high as two million. Persons working on more than one farm during the survey week are counted only once by the Census Bureau, but they are counted by the BAE on each farm where they work and meet the minimum hour requirements. This group is also more numerous during the harvest season when the demand for farm labor is greatest. The additional count of workers attributable to this duplication is estimated at a minimum of a quarter of a million and may be considerably larger. The third group is composed of persons who work in both agricultural and nonagricultural employment, but work longer at the nonagricultural job; they are classified by Census as working in non-agricultural employment, but by BAE as working on a farm. This last group may range from one-half million to a million in different seasons of the year.

Other groups counted by the BAE but not by the Census Bureau are imported foreign workers and some migratory workers not living in private households. On the other hand, the Census Bureau includes in its estimates of agricultural employment certain classes of workers which the BAE does not include. Persons with "nonfarm" occupations who are working on farms, such as bookkeepers and typists, some persons in certain agricultural processing activities, and farm operators with no other job who did no farm work are considered as employed in agriculture by the Census Bureau, but are not included by the BAE in its estimates of agricultural employment.

Because the volume of agricultural employment is affected by changes both in season and in weather, the difference in the week of the month for which the data are collected may also make some difference. The BAE data relate to the last full calendar week ending at least one day before the end of the month while the Census Bureau information relates to the week containing the 8th of the month.

The BAE estimates farm employment from current reports made by a selected group of farmers adjusted to enumerative survey bench mark data. The Bureau of the Census bases its figures on a sample of dwelling units. Accordingly, the figures in both cases are subject to a sampling variation and may differ from the results of a complete census.

Wage rates

Wage rates are reported quarterly by the same sample of farm operators that reports employment. The farmer is asked to report average wage rates being paid "at this time" in his locality. The "at this time" on the average probably represents the second or third day before the end of the month.
